

Aiming the last RCS: required tilt vs bearing, against the site's own θ_{free} — inside the green curve you need a corridor, outside you don't

θ_{free} is set by the site's own geometry: above it the near beam reaches navigable airspace BEFORE leaving the fence — no corridor, no easement, no overflight. It dips to ~ 35 mrad toward ENE because the IP sits on the site's EAST edge: 4.7 km of Fermilab land lies WSW, only 0.9 km east. Bands are GEBSCO-verified submerged runs; dots are the verified aim points.
