

The collider in its default aim, and everything around it
bearing around, log range radial (each ring also gives the tilt that reaches it); dashed = the 15.40 mrad exit circle

Lakes are real footprints projected into this frame; every landmark is placed by its true bearing and range from the IP. The collider's whole 198 km circle lies inside θ_{free} , so at 15.4 mrad the near beam is corridor-bound in every bearing – which is why the study rides the ComEd right-of-way north. Ranges and bearings: static/geo/collider_map.json.
